

DRENCH RESISTANCE

Invest in your farm's future!
Know your drench status by doing a reduction test.

Organise a full Faecal Egg Count Reduction Test (FECRT)

Weaning is the time to do a FECRT

The purpose of a FECRT is to provide you with data on the drench effectiveness and resistance status of the parasite population on your property. This will help ensure that the drenches you use on your farm are highly effective. A significant driver of drench resistance is the continued use of ineffective drench products.

"You can't afford to be drenching with a product that doesn't work!"

- Analysis of the major drench activities.
- Larval culture and identification of resistant worm species.
- Full report for effective drench selection and an animal health plan.

Contact your prime vet, or phone our helpful team to arrange a test today!

For advice you can trust!

Abortion Storms

Two Diseases Two Vaccines

Order ToxoVax EARLY!

Toxoplasma is present on 100% of New Zealand farms, and Campylobacter on 88%*1 – but both are equally important. These two diseases can cause abortion storms with losses up to 30%, or more, of lambs*2,3.

Preventing them takes two vaccines. Maiden ewes require 1 dose of ToxoVax and 2 doses of CampyVax4 ahead of mating.

A booster of CampyVax4 is required in the following year, and an annual dose is recommended before mating is completed.

ToxoVax

- ✓ Controls the risk of Toxoplasma. **Live** vaccine.
- ✓ Up to 8% higher lambing percentages (3% national average).
- ✓ Vaccinate at least 4 weeks prior to first mating.
- ✓ One shot gives a lifetime immunity.
- ✓ **MUST BE ORDERED AT LEAST 4 WEEKS IN ADVANCE OF TREATMENT** to ensure availability.

CampyVax4

- ✓ Controls the risk of Campylobacter.
- ✓ Increase lambing by an average 9%.
- ✓ Protect maiden ewes with TWO shots 4-6 weeks apart, and one booster shot in previously vaccinated ewes.

Example for early April mating 2 Tooth/Hogget Pre-mating Animal Health Programme

Flexidine

For the treatment of Iodine deficiency in sheep from mating to weaning.

Use 4-6 weeks pre-tup for Iodine supplementation, in a sustained release formulation.

*This is a prescription medicine only available following a veterinary consultation.

Pre-Mating Reminders

It is critical to get it right, as it is impossible to correct any mistakes until next season. The work pre-mating determines the potential performance of your flock for the upcoming season. Nothing can increase scanning percentages once the mating has finished!

Things to check include:

- ✓ Ram health and soundness
- ✓ Ewe body condition
- ✓ Feeding levels
- ✓ Trace element status
- ✓ Ability of the ewe to conceive and maintain pregnancy

Don't leave your ewe flock unprotected ... **it's not worth the risk!**
