VETERINARY CENTRE

Drenching Dairy Cattle in Autumn

- There is considerable trial work available both nationally and in our district showing that drenching lactating dairy cattle is likely to result in an increase in milk solids production.
- Cydectin pour on and Eprinex are 2 of the most effective anthelmintics, both having significant persistent activity against Ostertagia species of 4 weeks or more.
- Both Cydectin and Eprinex have nil meat and nil milk withholds making their use in lactating herds very easy to manage.
- Genesis cattle pour on is a premium abamectin product with 14 days persistent activity. It has 35 days meat withhold so needs to be managed carefully when making culling decisions.

Whatever your approach to autumn drenching of your herd we are always available to give professional advice on the products available that will optimise your herd performance.
