Cotton's Corner

Daylight savings is here, the days are longer and summer is on its way! But that means those pesky fleas are back hanging around looking to cause trouble. My people just gave me my flea treatment the other day so at least I'm covered for now. I've also had a few furry friends come in lately with the old summer itches but luckily my people have got them

sorted pretty quick smart! So if your battling with an attack of the itches or those pesky fleas are bothering you, send your people down to your local Blue Cross Veterinary Centre clinic and I'll make sure you get sorted, that way you can get those fabulous summer bodies out too!

LAST YEARS

Hokey Pokey

Zoe Denize, 12 Years Old, Weston Primary School.

His ears, the peaks of great mountains Laid in velvety amber cloth

His eyes, like clumsy lions, with orange and amber, as soft as the wind itself, with a touch of the wild plants that grow in the paddock, while his pupils are a deep comforting black. His small nose, splodged in white, cotton sown, delicate twitchy whiskers and a small but chaotic smirk, adds to his clumsy personality.

His coat, long, thick, and glossy, a beautiful amber with

organized patches of white is layered (and sometimes matted) with scents of the

While his giant, tiger-like paws are padded with light and fluffy winter snow. His tail, a sunset orange, laid in slightly darker amber stripes, with a creamy soft white tip.

The creamy, sweet, smooth, clumsy personality of his, lights up the hearts of those around him:

My handsome feline friend, Hokey Pokey. Just how I like him:

Royal Canin formulated Dry Food for Skin Support.

Ask our vets what's best for your pet!

Interesting Case

THE IMPORTANCE OF SKIN TESTING

Many skin conditions, caused by different diseases (e.g., allergy, parasites, fungal or bacterial infections, even cancer), look the same on the surface. The skin can respond to any of these diseases by becoming inflamed, developing crusts, lumps, losing hair, becoming thickened or turning black, especially if they go on for a long time. This is why, with most skin cases, your vet will take some quick and easy samples of the skin to look at under the microscope and may send some off to the laboratory, to try and work out what the underlying cause is. Early and thorough diagnosis may reduce costs later on and help prevent the secondary changes that make management harder.

Lucy is a great example of this. She had been initially treated with medication designed to reduce the irritation but then had gone through periods of getting better and worse. When she eventually came to the Veterinary Centre it was not possible to tell what was wrong with her skin just by looking. We started from scratch looking closely at the skin under the microscope – looking for mites, bacteria and yeast. This showed a mild infection, but the key was to send a sample off to the laboratory to ensure she didn't have fungal disease. Sure enough, Lucy had an unusual and severe type of ringworm that affected her but not anyone around her, one she wasn't able to shake on her own. The inhouse test we used (looking at the fur under UV light) had been negative and so getting the laboratory sample had been vital to her diagnosis. Lucy was then started on an appropriate medication for her condition and is now a much happier dog. Even though her hair loss and skin colour changes are permanent, Lucy is now recovering well and living in comfort.

Skin conditions can be ongoing and frustrating and developing a team approach between pet, owner and veterinarian is key.
